ABSTRACT OF DISCLOSURE

relates to a pyrotechnic device between two elements subjected to tensile and compressive forces. The device comprises at least one locking element along at least one of the elements in the locking direction. The device is released by the action of the pyrotechnic charge, which is characterised in that the locking element (21) is able to resist the action of the gas pressure (23), the locking element (21) at its ends is provided with means for their retention.
